REG. DESIGN

This new Megabolt dolly has been developed by Custom Mining Products to facilitate the installation of Megabolts and eliminates the need for ladders during the Megabolt installation process. The new dolly installs the Megabolt, the plate, the barrel and wedge all together in one smooth operation. Once the bolt has been installed and flushed, the dolly removes the plastic barrel and wedge cap, leaving the Megabolt ready for tensioning.

- Installs the Megabolt, the plate, the barrel and wedge in one smooth operation
- Removes the plastic barrel and wedge cap once bolt has been installed
- Eliminates the use of ladders during the installation process
- Eliminates “short bolts” with the tail of each bolt left at the correct length for Tensioning
- Uses the power of the machine to push the installed bolt and plate hard up to the roof
- Installed bolt able to take some weight immediately – giving some protection in bad conditions
- Dolly keeps all bolt tails to a minimum length, ideal for low roof conditions on roads and walk ways
- Reduces tensioning times, with most bolts requiring only 1 bite with the tensioner head
- Speeds up production by Eliminating the need to plate the bolts at another time
- Ideal for high roof areas where a LHD and man basket cannot be used
- For use on Miners , Drill rigs and hand bolters
- Protected by Australian Design Application Number: 201512818
